

What the controller sees — and where it is tested

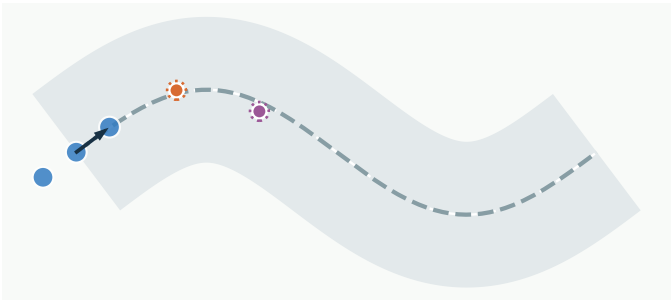

Recorded simulation scenes • four road layouts • seed-matched controller comparison

1-4 obstacles / 1-4 shared-history classes ($C \leq O$) / 1-6 modes / seeds 77-86

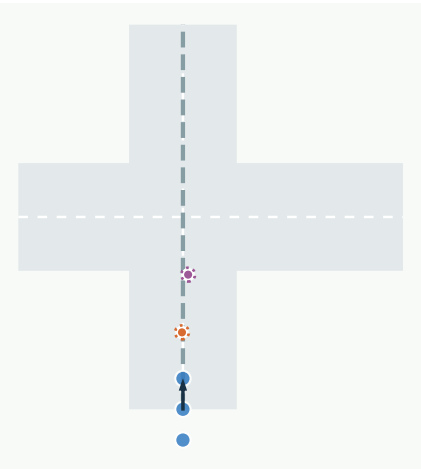

01 Straight highway

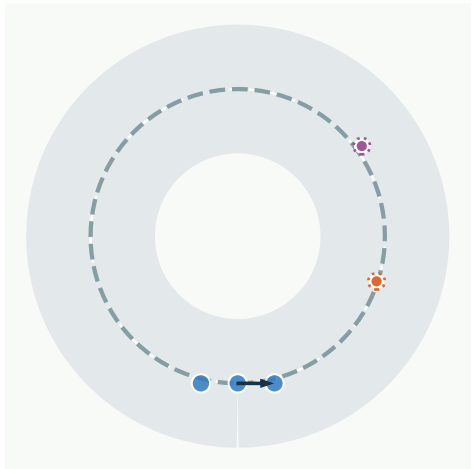

02 S-curve

03 Four-way intersection

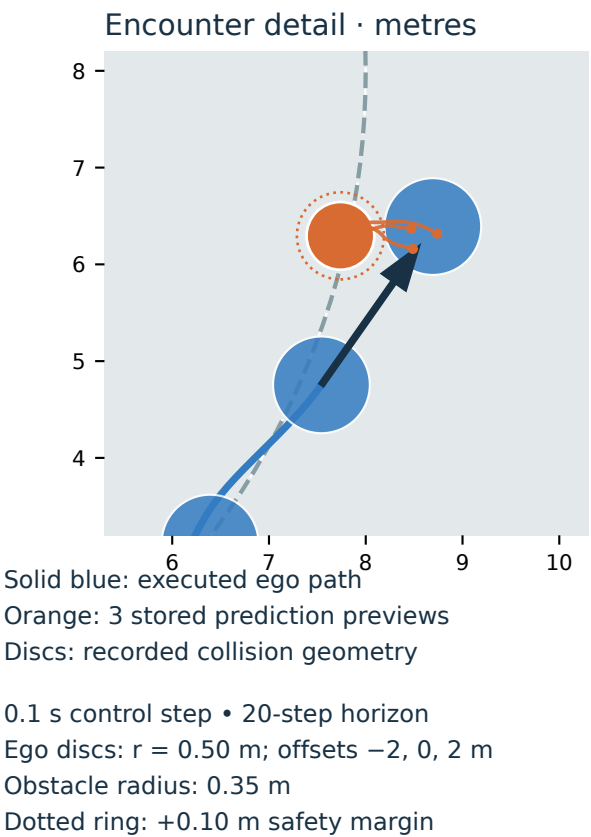

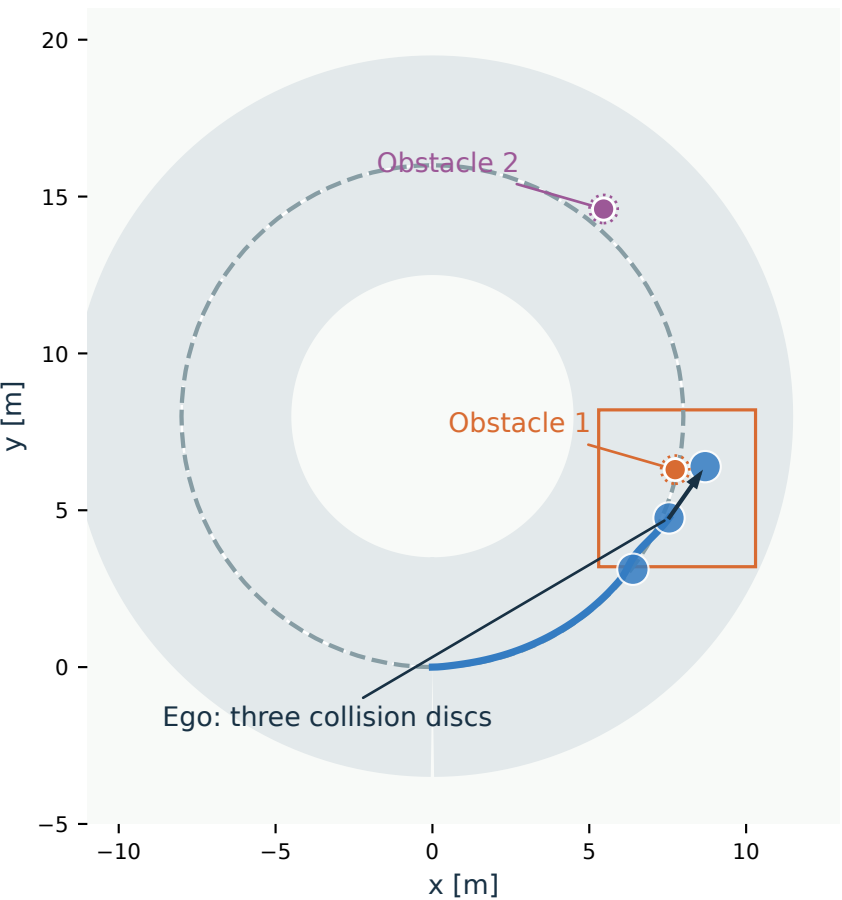

04 Roundabout

Same seed and configuration in each map: 2 obstacles, 2 classes, 3 modes. Initial positions shown; dashed line = reference route.

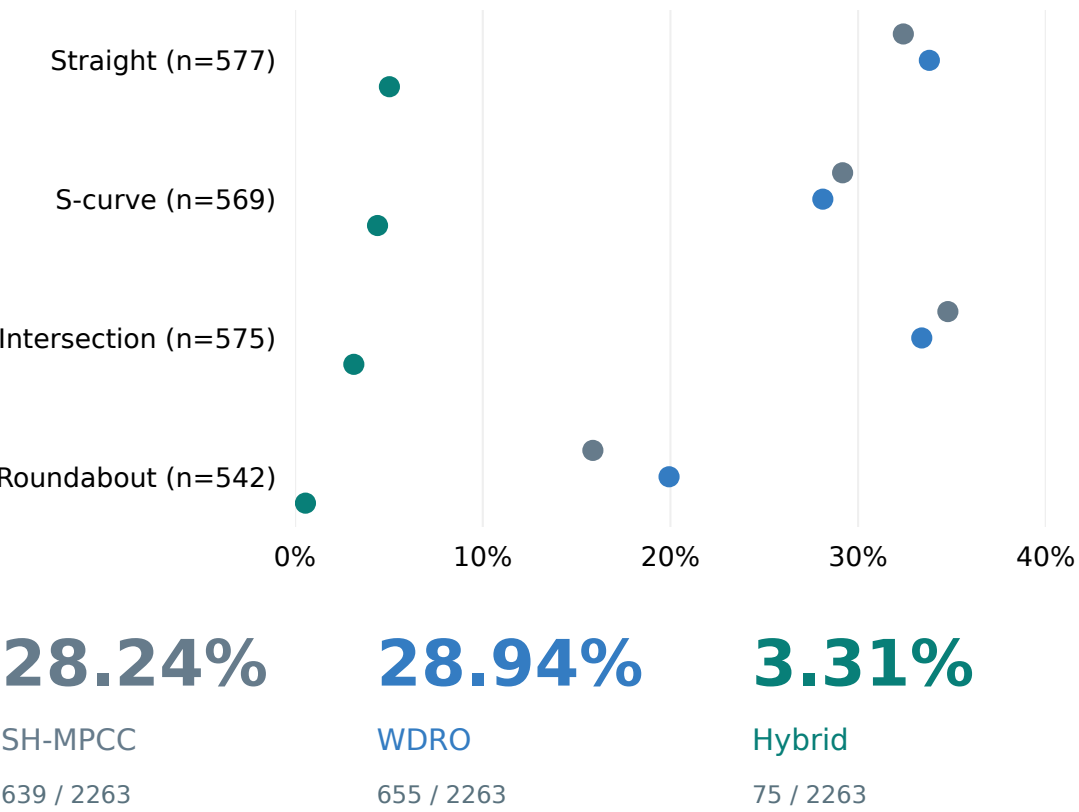

A recorded planning scene

Roundabout • WDRO • seed 77 • $t = 6.0$ s

No-admissible-control outcomes

2,263 matched trials per controller • lower is better

DESIGN 720 configurations $\times$ 10 seeds = 7,200 scheduled trials. Matched analysis retains 2,263 / 2,400 configuration-seed triplets.

137 triplets excluded because at least one controller run was not OK. Maps illustrate one setup; rates aggregate all matched setups. No new simulations.
